
CSSE 230 Day 2

Growable Arrays Continued
Big-Oh notation

Submit Growable Array exercise

Agenda and goals

- Growable Array recap
- Big-Oh definition

- After today, you'll be able to
  - Use the term *amortized* appropriately in analysis
  - State the formal definition of big-Oh notation

Announcements and FAQ

- You will not usually need the textbook in class
- All should do piazza introduction post (a few students left)
- Turn in GrowableArrays now.
- Quiz problems 1-5. Do on your own, then compare with a neighbor.

You must demonstrate programming competence on exams to succeed

- See syllabus for exam weighting and caveats.
- Note evening exams
- Think of every program you write as a practice test
  - Especially TreePractice Small Programming HW and Exam 2 (programming only)

Review these as needed

Properties of logarithms

$$log_b(xy) = log_b(x) + log_b(y)$$

$$log_b\left(x/y\right) = log_b(x) - log_b(y)$$

$$log_b(x^\alpha) = \alpha log_b(x)$$

$$log_b(x) = \frac{log_a(x)}{log_a(b)}$$

$$a^{log_b(n)} = n^{log_b(a)}$$

Properties of exponents

$$a^{(b+c)} = a^b a^c$$

$$a^{bc} = \left(a^b\right)^c$$

$$a^b/_{a^c} = a^{(b-c)}$$

$$b = a^{log_a(b)}$$

$$b^c = a^{c*log_a(b)}$$

Practice with exponentials and logs

(Do these with a friend after class, not to turn in)

Simplify: Note that log n (without a specified) base means $\log_2 n$.
Also, log n is an abbreviation for log(n).

1. $\log (2\ n \log n)$
2. $\log(n/2)$
3. $\log (\text{sqrt } (n))$
4. $\log (\log (\text{sqrt}(n)))$
5. $\log_4 n$
6. $2^{2 \log n}$
7. if $n=2^{3k} - 1$, solve for k.

Where do logs come from in algorithm analysis?

Solutions

No peeking!

Simplify: Note that log n (without a specified) base means $\log_2 n$.
Also, log n is an abbreviation for log(n).

1. $1+\log n + \log \log n$
2. $\log n - 1$
3. $\frac{1}{2} \log n$
4. $-1 + \log \log n$

5. $(\log n) / 2$
6. n^2
7. $n+1=2^{3k}$
   $\log(n+1)=3k$
   $k= \log(n+1)/3$

A: Any time we cut things in half at each step
(like binary search or mergesort)

Warm Up and Stretching thoughts

- Short but intense! ~50 lines of code total in our solutions
- Be sure to read the description of how it will be graded. Note how style will be graded.
- **Demo**: Running the JUnit tests for test, file, package, and project
- PriorityQueue
- Loop engineering

Questions?

- About Homework 1?
  - Aim to complete tonight, since it is due after next class
  - It is substantial
  - The last problem (the table) is worth lots of points!
- About the Syllabus?

Homework 1 help

How many times is line 4 executed?

```
1 int sum = 0;
2 for (int k = 4; k < n; k++)
3    for (int j = 0; j <= n; j++)
4       sum++;
```

Why is this one so easy?
Does the inner loop depend on outer loop?
What if inner loop were `(int j = 0; j <= k ; j++)`?

Homework 1 help

How many times is line 3 executed?

```
1 int sum = 0;
2 for (int k = 1; k <= n; k *= 2)
3    sum++;
```

Be precise:

using floor/ceiling as needed, to earn full credit

Growable Arrays Exercise

Daring to double

Growable Arrays Table

N	E_N	Answers for problem 2
4	0	0
5	0	0
6	5	5
7	5	5 + 6 = 11
10	5	5 + 6 + 7 + 8 + 9 = 35
11	5 + 10 = 15	5 + 6 + 7 + 8 + 9 + 10 = 45
20	15	sum(i, i=5..19) = 180 **using Maple**
21	5 + 10 + 20 = 35	sum(i, i=5..20) = 200
40	35	sum(i, i=5..39) = 770
41	5 + 10 + 20 + 40 = 75	sum(i, i=5..40) = 810

Doubling the Size

- Doubling each time:
  - Assume that $N = 5\ (2^k) + 1$.
- Total # of array elements copied:

k	N	E_N–Doubling I.e., # times line 38 executed
0	6	5
1	11	$5 + 10 = 15$
2	21	$5 + 10 + 20 = 35$
3	41	$5 + 10 + 20 + 40 = 75$
4	81	$5 + 10 + 20 + 40 + 80 = 155$
k	$= 5\ (2^k) + 1$	$5(1 + 2 + 4 + 8 + \ldots + 2^k)$

Express as a closed-form expression in terms of K, then express in terms of N

Doubling the Size (solution)

- Assume that $N = 5\ (2^k) + 1$.
- Total # of array elements copied
  $= 5(1 + 2 + 4 + 8 + \ldots + 2^k)$
- **Do in terms of k, then in terms of N**

Adding One Each Time

- Total # of array elements copied:

N	E_N-Add1 I.e., # times line 38 executed
6	5
7	5 + 6
8	5 + 6 + 7
9	5 + 6 + 7 + 8
10	5 + 6 + 7 + 8 + 9
N	???

Express as a closed-form expression in terms of N

Conclusions

- What's the amortized cost of adding an additional string…
  1. in the doubling case?
  2. in the add-one case?

Amortized cost means the "average per-operation cost" while adding to a single GrowableArray many times.

Do the following to get answer for Q6 & Q7:

1. E_N-Doubling/N = ?
2. E_N-Add1/N = ?

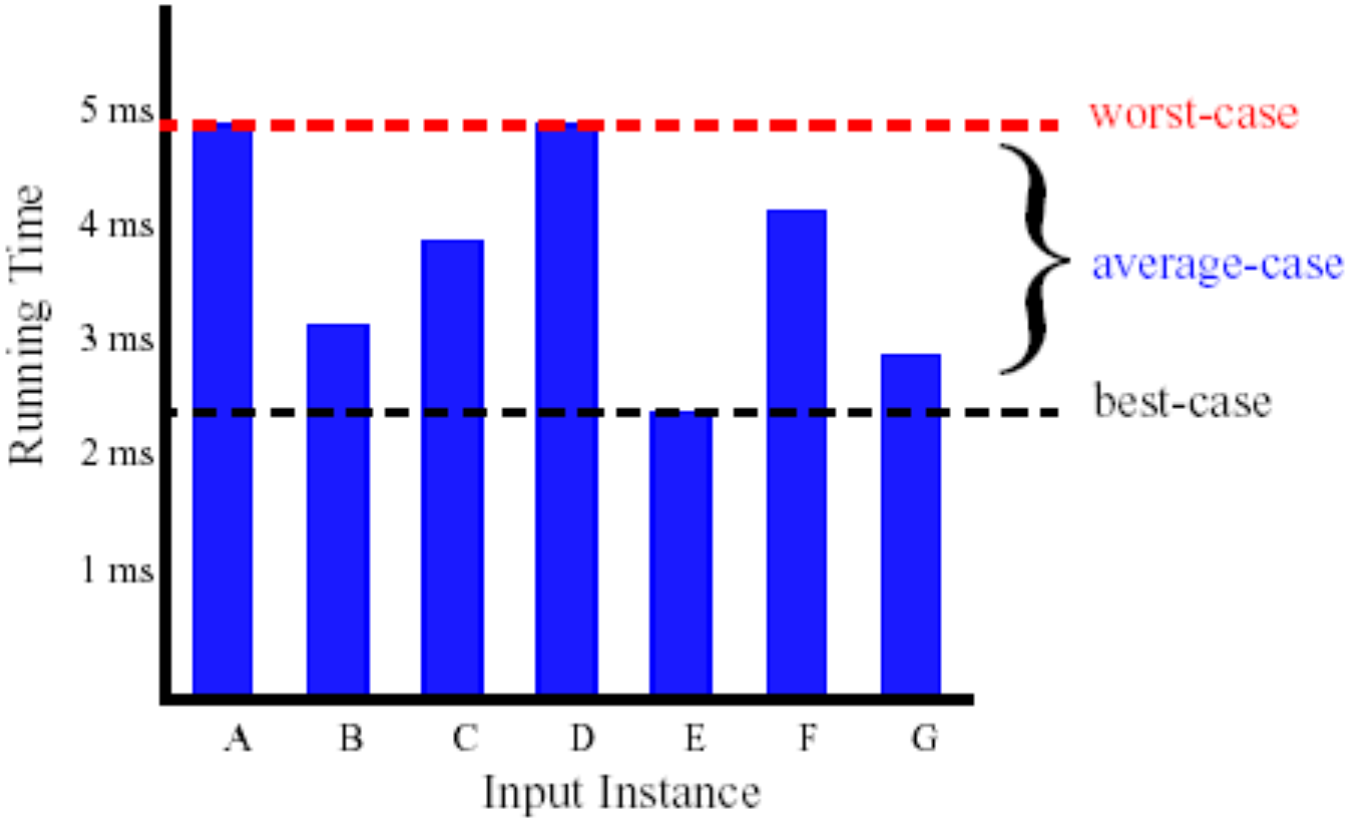
- So which method for increasing array size should be used?

Algorithm Analysis: Running Time

Running Times

- Algorithms may have different *time complexity* on different data sets
- What do we mean by "Worst Case"?
- What do we mean by "Average Case"?
- What are some application domains where knowing the Worst Case time complexity would be important?
- http://cacm.acm.org/magazines/2013/2/160173-the-tail-at-scale/fulltext

Average Case and Worst Case



Insertion Sort

- Basic idea:
  - Think of the array as having a sorted part (at the end) and an unsorted part (the beginning)

0	1	2	3	4	5	6	7	8	9
537	388	310	438	974	10	121	7	79	1391

  - Take the rightmost item in the unsorted part
  - Insert that item into the sorted part in such a way that the sorted part remains sorted and grows in size by 1

Repeat until unsorted part is empty

Insertion Sort – Worst & Best

- Inputs that cause worst and best cases
- Which one causes worst case, #1 or #2?

#1

0	1	2	3	4	5	6	7	8	9
7	10	79	121	310	388	438	537	974	1391

#2

0	1	2	3	4	5	6	7	8	9
438	388	310	121	79	10	7	537	974	1391

Selection Sort

- Basic idea:
  - Think of the array as having a sorted part (at the end) and an unsorted part (the beginning)

0	1	2	3	4	5	6	7	8	9
7	388	310	438	79	10	121	537	974	1391

  - Find the *largest* value in the unsorted part
  - Move it to the *beginning* of the sorted part (making the sorted part bigger and the unsorted part smaller)

Repeat until unsorted part is empty

Notation for Asymptotic Analysis

Big-Oh

Asymptotic Analysis

- We only care what happens when N gets large, where N is the size of the input
- Is the function linear? quadratic? exponential?

- *running time* – # of instructions executed as a function of N
- *observed running time* – amount of clock time required to execute code as a function of N

Figure 5.1

Running times for small inputs

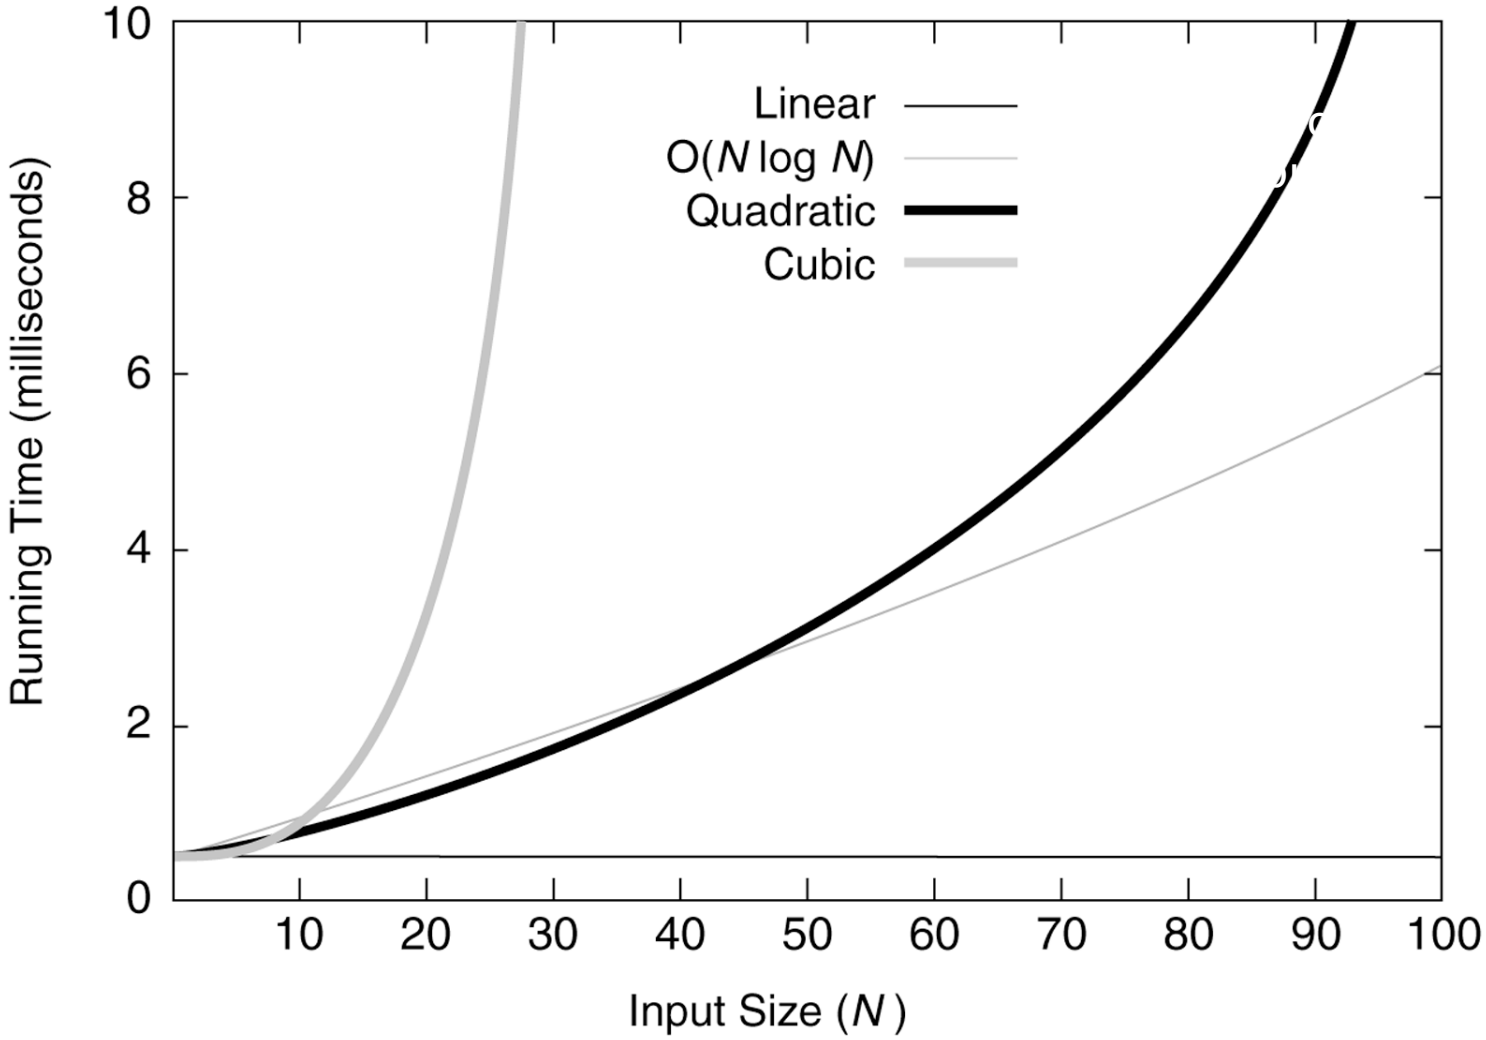


Figure 5.2

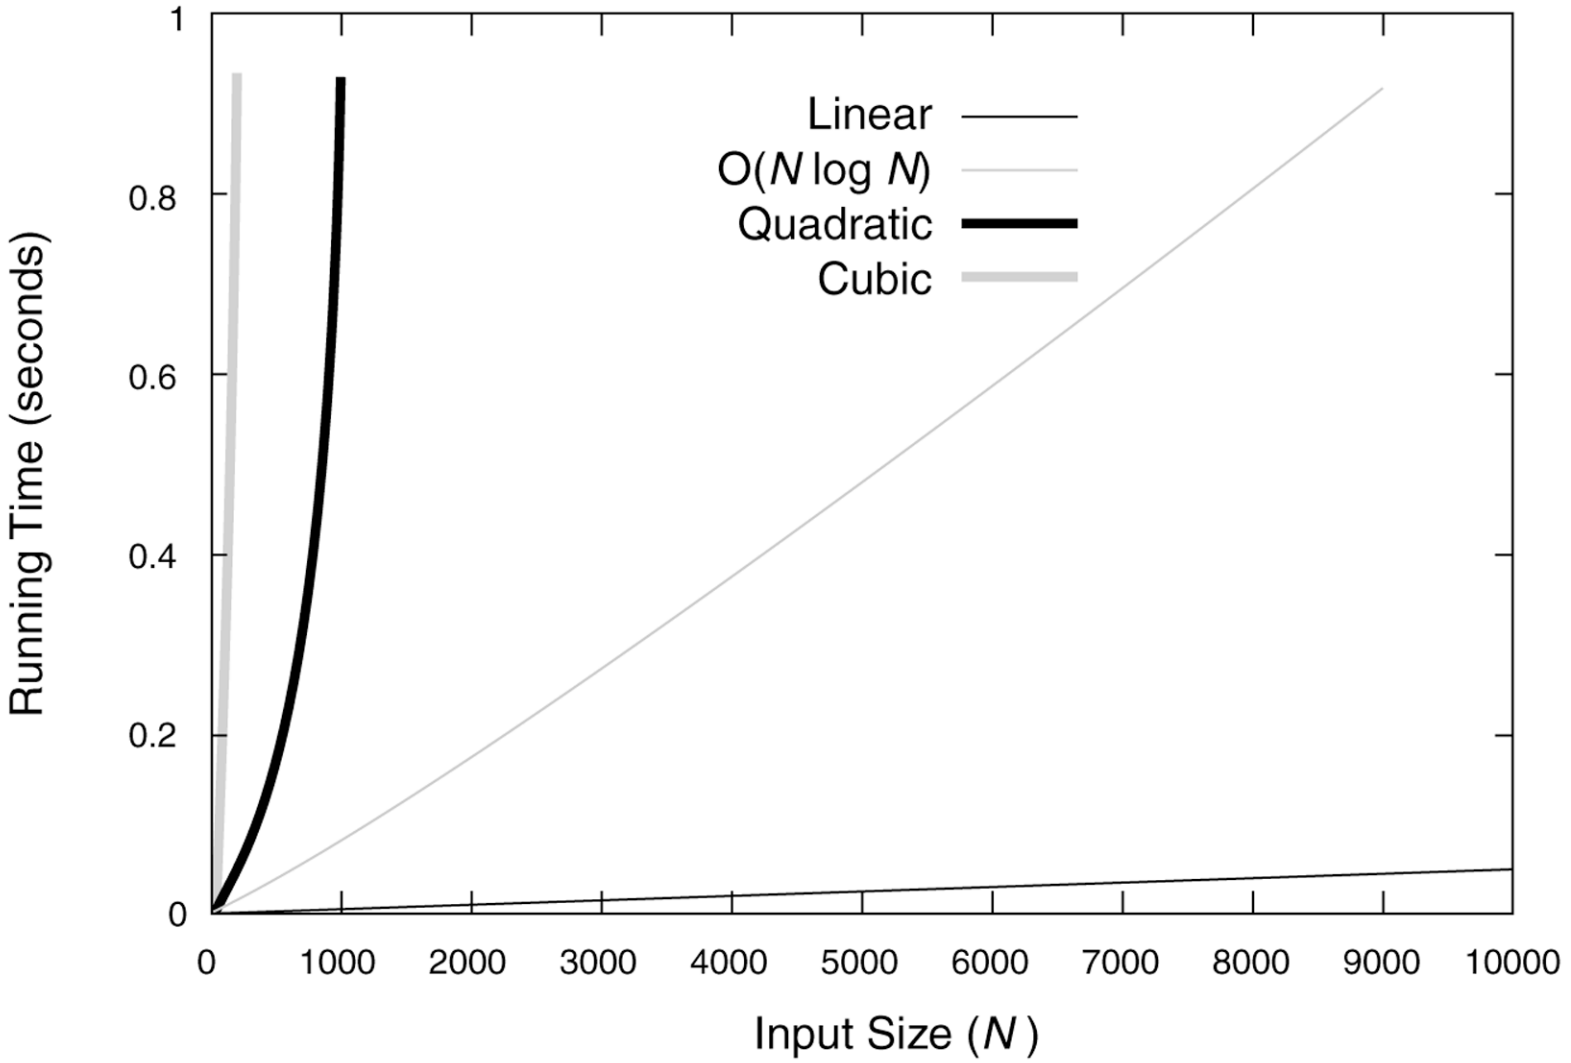
Running times for moderate inputs



Performance Analysis Basics

Come up with a math function f(n) such that it does the following:

- input: n = size of the problem to be solved by the algorithm
  - output: y = f(n) - the number of instructions executed (*running time*)
  - Only care about Quadrant I

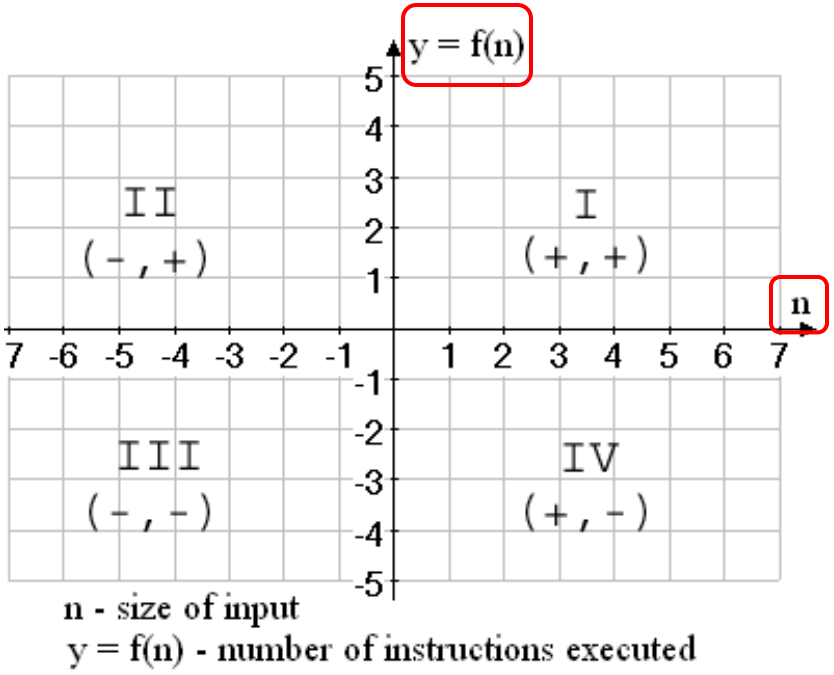


Figure 5.3

Functions in order of increasing growth rate

Function	Name
c	Constant
$\log N$	Logarithmic
$\log^2 N$	Log-squared
N	Linear
$N \log N$	N log N
N^2	Quadratic
N^3	Cubic
2^N	Exponential

The answer to most big-Oh questions is one of these functions

a.k.a "log linear"

Simple Rule for Big-Oh

Steps:

1. Drop lower order terms
2. Change constant coefficients to 1

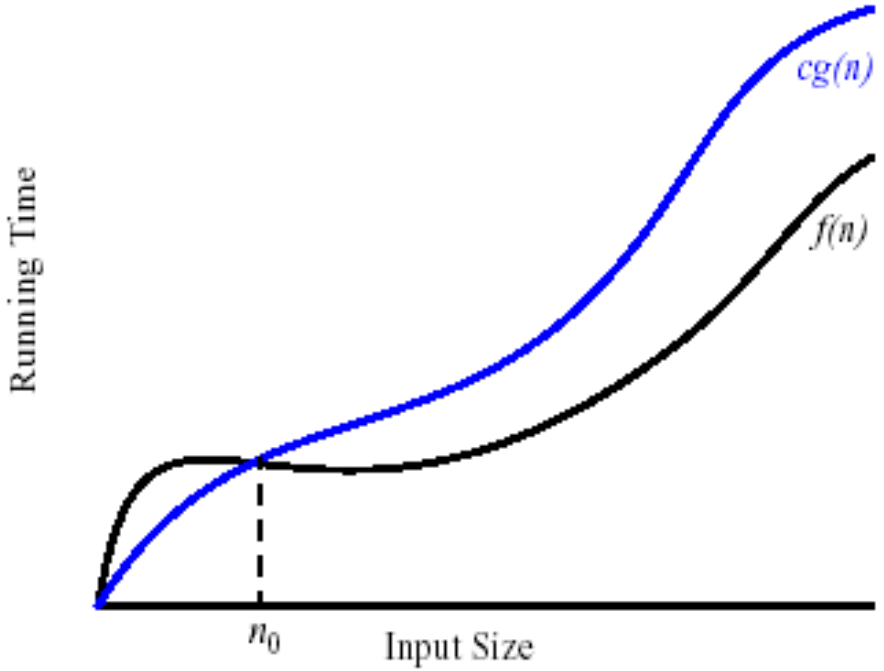
- $7n^1 - 3n^0$ **becomes** $O(n)$
- $8n^2\log(n) + 5n^2 + n$ becomes $O(n^2\log(n))$

Formal Definition of Big-Oh

- Given functions f(n) and g(n), we say that f(n) is O(g(n)) if and only if there exist constants $c > 0$ and $n_0 \geq 0$ such that

$$f(n) \leq c\, g(n) \text{ for all } n \geq n_0.$$

- For this to make sense, f(n) and g(n) should be functions over non-negative integers.



To *prove* Big Oh, find 2 constants and show they work

- A function f(n) is (in) O(g(n)) if there exist two positive constants **c** and $\mathbf{n_0}$ such that *for all* $n \geq n_0$, $f(n) \leq c\ g(n)$
- **Q: How to prove that f(n) is O(g(n))?**
  A: Give c and $\mathbf{n_0}$

Assume that all functions have non-negative values, and that we only care about $n \geq 0$. For any function g(n), O(g(n)) is a set of functions.

- Ex: f(n) = 4n + 15, g(n) = ???.

To *prove* Big Oh, find 2 constants and show they work

- A function f(n) is (in) O(g(n)) if there exist two positive constants **c** and $\mathbf{n_0}$ such that for all $n \geq n_0$, $f(n) \leq c\ g(n)$
- **Q: How to prove that f(n) is O(g(n))?**
  A: Give c and $\mathbf{n_0}$

- Ex 2: $f(n) = n + \sin(n)$, $g(n) = ???$
