Case 2. $q \leq j$

CSSE 230 Day 4

Maximum Contiguous Subsequence Sum

After today's class you will be able to:

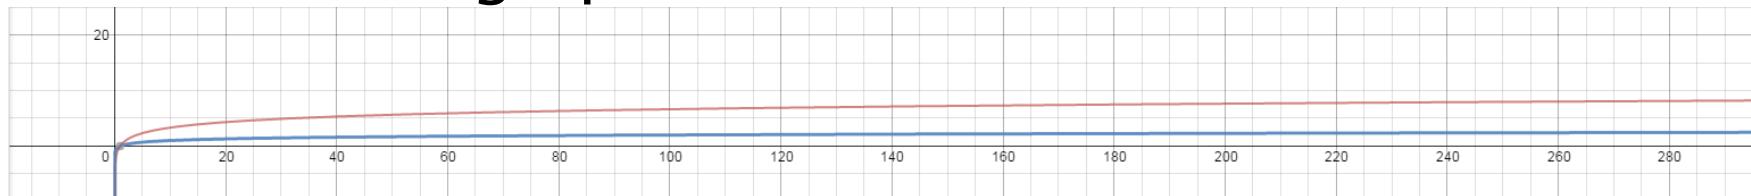

provide an example where an insightful algorithm can be much more efficient than a naive one.

November 6 at 12:30pm ·

In your class, I never thought I'd actually use big O notation, but now I find myself using it in my complaints to coworkers about how a previous developer would sort a list before doing a binary search to find a single element $O(n\log n) + O(\log n)$ instead of just doing a linear search $O(n)$. I feel really nerdy now (as if I didn't before 😊)

Like · Comment

So why would we ever sort first to do binary search?

Recap: MCSS

Problem definition: Given a non-empty sequence of n (possibly negative) integers A_1, A_2, \dots, A_n , find the maximum consecutive subsequence $S_{i,j} = \sum_{k=i}^j A_k$, and the corresponding values of i and j .

Reminder: we use 0-based indexing.

Recap: Eliminate the most obvious inefficiency, get $\Theta(N^2)$

```
for( int i = 0; i < a.length; i++ ) {  
    int thisSum = 0;  
    for( int j = i; j < a.length; j++ ) {  
        thisSum += a[ j ];  
  
        if( thisSum > maxSum ) {  
            maxSum = thisSum;  
            seqStart = i;  
            seqEnd   = j;  
        }  
    }  
}
```

- ▶ Exhaustive search: find every $S_{i,j}$

MCSS is $O(n^2)$

► Is MCSS $\theta(n^2)$?

- To show a problem is $\theta(g(n))$ you have to show both O and Ω
- Showing that a *problem* (e.g., the MCSS problem) is $\Omega(g(n))$ is much tougher
- How do you prove that it is impossible to solve a problem more quickly than you already how to with a known algorithm?
- Can we find a yet faster algorithm for MCSS?
 - If so, it can't use exhaustive search. (Why?)

$f(n)$ is $O(g(n))$ if $f(n) \leq cg(n)$ for all $n \geq n_0$

- So O gives an upper bound

$f(n)$ is $\Omega(g(n))$ if $f(n) \geq cg(n)$ for all $n \geq n_0$

- So Ω gives a lower bound

$f(n)$ is $\theta(g(n))$ if $c_1g(n) \leq f(n) \leq c_2g(n)$ for all $n \geq n_0$

- So θ gives a tight bound

◦ $f(n)$ is $\theta(g(n))$ if it is both $O(g(n))$ **and** $\Omega(g(n))$

Observations?

- ▶ Consider $\{1, 4, -2, 3, -8, 4, -6, 5, -2\}$

- ▶ Any subsequences you can safely ignore?
 - Discuss with another student (2 minutes)

Observation 1

- ▶ We noted that a max-sum sequence $S_{i,j}$ cannot begin with a negative number.
- ▶ Generalizing this, it cannot begin with a prefix $A_{i,k}$ with $k < j$ whose sum is negative.
 - **Proof by contradiction.** Suppose that $S_{i,j}$ is a max-sum sequence and that $S_{i,k}$ is negative. In that case, a larger-sum contiguous sequence can be created by removing $S_{i,k}$. However, this violates our assumption that $S_{i,j}$ is a max-sum contiguous sequence.

Observation 2

- ▶ All contiguous subsequences that border the maximum contiguous subsequence must have negative or zero sums.
 - **Proof by contradiction.** Consider a contiguous subsequence that borders an MCSS sequence. Suppose it has a positive sum. We can then create a larger max-sum sequence by combining both sequences. This contradicts our assumption of having found a max-sum sequence.

Observation 3

- ▶ Imagine we are growing subsequences from a fixed left index i . That is, we compute the sums $S_{i,j}$ for increasing j .
- ▶ Claim: If there is such an $S_{i,j}$ that “just became negative” (for the first time, with the inclusion of the j^{th} term), any subsequence starting in between $i + 1$ and j cannot be a MaxCSS (unless its sum equals an already-found MaxCSS)!
- ▶ In other words, as soon as we find that $S_{i,j}$ is negative, we can skip all sums that begin with any of A_{i+1}, \dots, A_j .
- ▶ We can “skip i ahead” to be $j + 1$.

Proof of Observation 3

- ▶ Proof by Contradiction. Suppose there is such a MaxCSS, namely $S_{p,q}$, where $i+1 \leq p \leq j$.

i $S_{i,j}$ just became negative! *j*

- ▶ Key point. What must be true of the following sums?

$$S_{i,p-1} \geq 0 \quad | \quad S_{p,j} < 0$$

Case 1. $q > j$

p

MaxCSS

q

Starts with a negative prefix. Violates Obs. 1!

Case 2. $q \leq j$

p

MaxCSS

9

Borders a subsequence with nonnegative sum.

Violates Obs. 2, or there is a previous MaxCSS with the same sum.

New, improved code!

```

public static Result mcssLinear(int[] seq) {
    Result result = new Result();
    result.sum = 0;
    int thisSum = 0;

    int i = 0;
    for (int j = 0; j < seq.length; j++) {
        thisSum += seq[j];

        if (thisSum > result.sum) {
            result.sum = thisSum;
            result.startIndex = i;
            result.endIndex = j;
        } else if (thisSum < 0) {
            // advances start to where end
            // will be on NEXT iteration
            i = j + 1;
            thisSum = 0;
        }
    }
    return result;
}

```

$S_{i,j}$ is negative. So,
skip ahead per
Observation 3

Running time is O (?)
How do we know?

What have we shown?

- ▶ MCSS is $O(n)$!
- ▶ Is MCSS $\Omega(n)$ and thus $\theta(n)$?
 - Yes, intuitively: we must at least examine all n elements

Time Trials!

- ▶ From SVN, checkout **MCSSRace**s
- ▶ Study code in **MCSS.main()**
- ▶ For each algorithm, how large a sequence can you process on your machine in less than 1 second?

MCSS Conclusions

- ▶ For a particular problem, e.g., MCSS, the first algorithm we devise may execute an order of magnitude more instructions than the best algorithm for that problem
- ▶ Sometimes we need clever ideas to improve our algorithms
- ▶ Showing that the faster algorithm is correct can require some serious thinking
- ▶ Software development is more about careful consideration than fast typing!

Interlude

- ▶ If GM had kept up with technology like the computer industry has, we would all be driving \$25 cars that got 1000 miles to the gallon.
 - Bill Gates
- ▶ If the automobile had followed the same development cycle as the computer, a Rolls-Royce would today cost \$100, get a million miles per gallon, and explode once a year, killing everyone inside.
 - Robert X. Cringely

Stacks and Queues

A preview of Abstract Data
Types and Java Collections

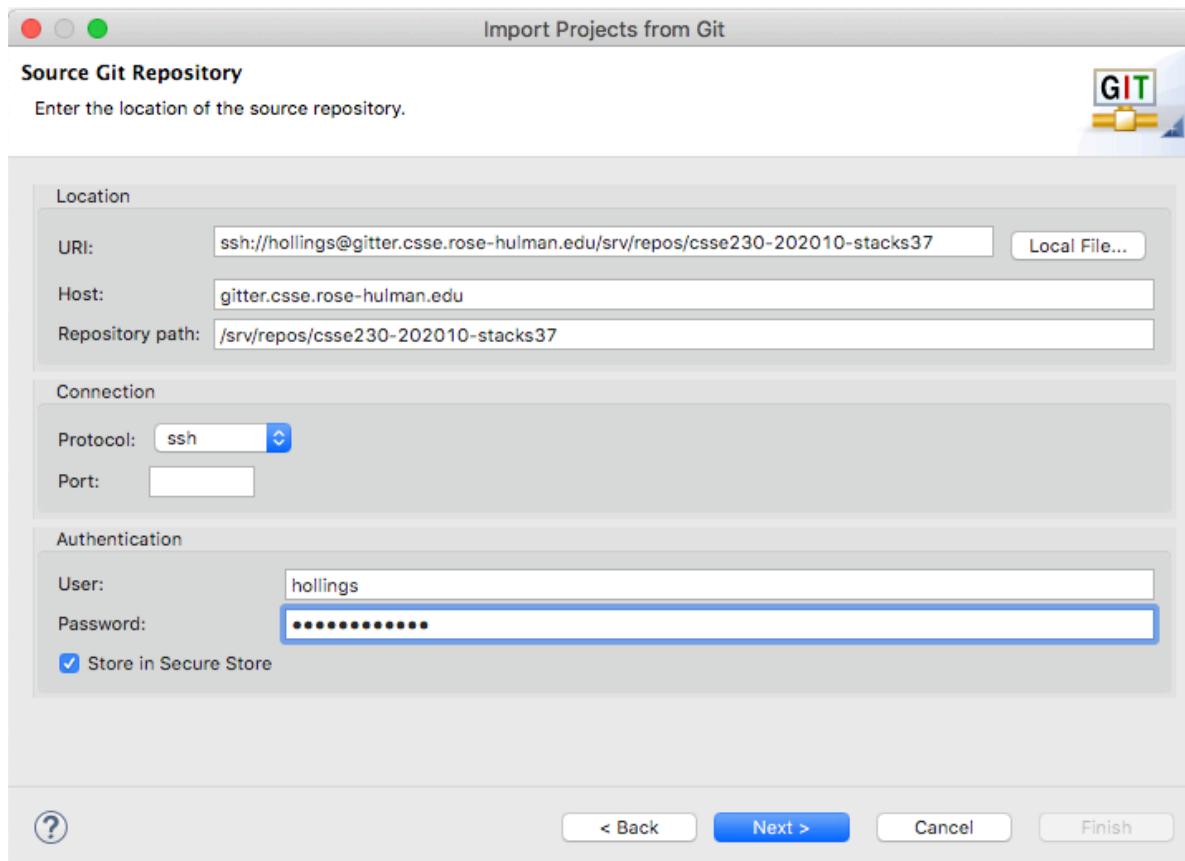

This week's major program

Stacks and Queues assianment

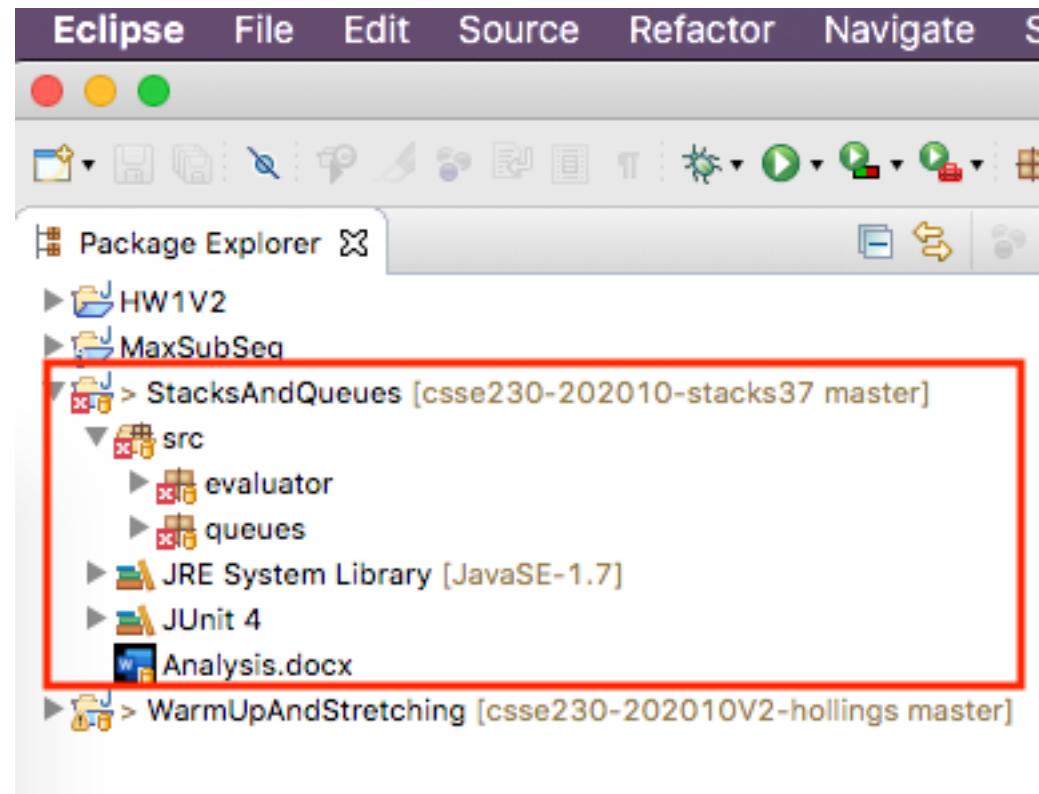

Step 1: Cloning a Repository

1. Open Eclipse and go to File > Import > Git > Projects from Git
2. Select "Clone URI"
3. Ignore the URI field for the moment, and fill out with the following:
 - Host: `gitter.csse.rose-hulman.edu`
 - Repository path: `/srv/repos/csse230-202010-USERNAME`, replacing `USERNAME` with your RHIT username
 - Connection protocol: ssh
 - User: your RHIT username
 - Password: your RHIT password
 - You can select Store in Secure Store to avoid having to enter credentials frequently.

The URI field should have been auto-filling as you filled the other fields, and should now read
`ssh://USERNAME@gitter.csse.rose-hulman.edu/srv/repos/csse230-202010-USERNAME`
with your username, of course. Hit Next.

Stacks and Queues assignment

- Implement `toString`
- Circular array implementation of Queue
- Point distribution

Stacks and Queues assignment

Intro: Ideas for how to implement stacks and queues using arrays and linked lists

How to write your own growable circular queue:

1. Grow it as needed (like day 1 exercise)
2. Wrap-around the array indices for more efficient dequeuing

Stacks and Queues implementation

Analyze implementation choices for Queues – much more interesting than stacks! (See HW)

Application: An exercise in writing cool algorithms that evaluate mathematical expressions:

Evaluate Postfix: 6 7 8 * +
(62. How?)

Convert Infix to Postfix: 6 + 7 * 8
(6 7 8 * + You'll figure out how)

Both using stacks.

Read assignment for hints on *how*.

Meet your partner

- ▶ Plan when you'll be working. We suggest that your first meeting should be today or tomorrow
- ▶ Review the pair programming video as needed
- ▶ Check out the code and read the specification together
